

Monetization & Access Policy

INTEGRITY FIRST, REVENUE ON SCALE & CONTINUITY

The governing framework for what TimeLogic charges for, what it never charges for, and why — so cost or connectivity never stands between an organization, verified proof of work, and worker equity.

01 — THE GOVERNING PRINCIPLE

Never let cost or connectivity stand between a worker and proof of their shift.

THE ONE-LINE POLICY

If it guarantees proof of work, workplace safety, or offline continuity during a power or network grid failure, it is free. If it involves heavy biometric AI compute, multi-branch fleet control, enterprise ERP integrations, or deep automated penalty and payroll rules, that is where TimeLogic earns revenue.

This is not merely an ethical stance — it is sound, scalable business. Platforms that dominate mission-critical enterprise infrastructure (e.g., Cloudflare in web resilience, Rippling and Deel in global workforce management) succeed on the exact same pattern: **a frictionless, zero-barrier entry point that builds universal operational trust and daily adoption, with high-margin revenue layered on top through compute-intensive services, hardware seat scaling, and enterprise compliance modules** — never by holding basic shift clock-ins hostage or bricking an offline terminal during an internet outage.

The practical test for any future feature or pricing decision: **does charging here risk a worker being unable to prove their presence, or an employer losing emergency attendance records during an outage?** If yes, it stays free or find another way to fund it. If the cost sits behind GPU biometric inference, hardware fleet management, or specialized enterprise automation, a fee is fair and sustainable.

02 — ALWAYS FREE, NO EXCEPTIONS

The features where a fee is never acceptable.

Zero-Downtime Offline Attendance & Local Data Resilience

The moment an ISP drops, fiber cuts, or power fluctuates, attendance verification cannot halt, fail, or demand an active billing check. Local IndexedDB/SQLite outbox queuing, optimistic headcount synchronization, and automatic background batch reconciliation are permanently free. Proof of work must never depend on active broadband or billing status.

Standard PIN & Credential Verification (Universal Fallback)

Every employee has an uncompromised right to clock in. If biometric cameras are damaged, lighting conditions fail, or an employee has biometric accessibility restrictions, standard alphanumeric PIN and password manual verification is free, instant, and unlimited across all tiers.

Statutory Labor Records & Audit Data Export

An organization's attendance and labor records belong entirely to them. Raw data exports (CSV, JSON, PDF logs), historical clock-in/out records, and basic compliance audit histories carry zero export taxes, archival fees, or retrieval paywalls.

Terminal Health Monitoring & Device Heartbeats

Basic station telemetry — monitoring whether a physical kiosk is online, tracking offline outbox queue depth, and alerting administrators to station power failures — is permanently free to ensure workplace safety and zero operational blind spots.

03 — WHERE THE REVENUE COMES FROM

Charge where a real, direct cost sits behind the feature.

1 **Biometric DeepFace AI compute & anti-spoofing inference**

Pay-per-enrolled biometric seat or high-concurrency cloud API. The one place a direct unit cost exists because running 512-dimensional vector embedding inference and anti-spoof neural nets consumes dedicated GPU/cloud compute.

2 **Multi-station kiosk terminal fleet licensing**

Hardware terminal seat subscription. A single central station is accessible; scaling across 5 warehouses, 10 retail branches, or 50 manufacturing gates requires dedicated fleet telemetry, remote lockouts, and token rotation.

3 **Dynamic rotating QR attendance & cryptographic geofencing**

Charged for the high-security anti-proxy protection of hybrid and mobile field teams — sub-30s TOTP tokens and Wi-Fi BSSID validation — eliminating buddy-punching beyond physical kiosks.

4 **B2B / ERP / automated penalty & payroll integrations**

The primary long-term institutional lever. Companies pay for automated multi-tier penalty deductions, overtime rules engines, and direct one-click payroll sync (Gusto, QuickBooks, Paystack, ADP) that save hundreds of manual HR calculation hours.

5 **Multi-branch & multi-tenant enterprise administration**

Centralized headquarters dashboard managing distributed branch locations, department-level permission hierarchies, regional holiday calendars, cross-branch floating employees, and consolidated corporate reporting.

6 **White-label kiosks, dedicated infrastructure & 24/7 SLA**

Custom corporate branding on kiosk terminal interfaces, dedicated database instances, custom data retention policies, 99.99% uptime guarantees, and dedicated solutions engineering support.

04 — THE DECISION FRAMEWORK FOR NEW FEATURES

A simple test for every future pricing decision.

STEP 1

Ask: does charging here risk a worker being unable to prove their presence, or an employer losing baseline attendance continuity during an outage?

IF YES

It stays free. Find another way to fund it — institutional contracts, cross-subsidy from premium biometric tiers, or hardware seat scaling — rather than charging the person or kiosk at the moment of shift check-in.

IF NO

Check whether a real, direct cost sits behind it — GPU biometric inference, hardware fleet management, or specialized enterprise automation. If so, a fee is fair and sustainable.

Apply this test before adding any new paywall, tier, or fee anywhere in the product — including features not yet built, like Predictive AI Rostering. It's easier to hold this line before a feature ships than to walk back a fee once organizations and workers are used to paying it.
